/note="Organ: mixed (see below); Vector: pT713D-Pac

(Pharmacia) with a modified polylinker; Site_1: Not I;

Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (melanocyte 2NDHM, pregnant uterus NbHH9U, and fetal heart NbHH9M) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223,

with a modified polylinker; Site I: EcoR I; Site 2: Not I;
NCI CGAP Chi is a cDNA library containing the following
tissue(B; Chondrosarcoma Grade II: The library was
constructed according to Bonaldo, Lennon and Soares,
Genome Research, 6:791-806, 1996. First strand cDNA
synthesis was primed with an oligo-dT primer containing a
Not I site. Double stranded cDNA was ligated to an EcoR I
adaptor, digested with Not I, and cloned directionally
into pT7T3-Pac vector. The oligonucleotide used to prime
the synthesis of first-strand cDNA contains a library tag
sequence that is located between the Not I site and the
modernorecon.

### CAN CONTAIN CONTAINS AND CONTAINS AND CONTAINS TAIL The Sequence tag for this library is

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 49, Application US/10204708

Patent No. 6677731

GENERAL INRORANTION:

APPLICANT: PIEPENBROCK, Christian
APPLICANT: Diagnosis of Diseases Associated with DNA Replication
ITILE OF INVENTION: Dy Assessing DNA Methylation
FILE OF INVENTION: Dy Assessing DNA Methylation
CURRENT PELING DATE: 2001-04-06
PRIOR APPLICATION NUMBER: DE 10019058.8

throughput methods for detecting differential expression of one or more throughput methods for detecting differential expression of one or more compounds in a sample, or screening several molecules or compounds to identify a light of the compounds to identify a light of the compounds to invention. A protein encoded by the cDNA may be used to screen several completes or compounds to identify a light of the protein that can be used to detect a protein in a sample or purify an antibody to the protein that can be used to detect a protein in a sample or purify a natural or compounds to the protein from a sample. The nucleotides may be useful for diagnosing, staging, treating, or monitoring the progression of treatment of a vascular disease, eg. atheroscalerosis, cancer, coronary artery disease, hypertension, diabetes, pre-eclampsia, ischeemia- reperfusion injury, restenosis, or stroke. The cDNAs can also be used for large-scale genetic or gene expression analysis of several new nucleic acid angleoules. Antibodies to the proteins encoded by the cDNAs are useful for diagnosing pre-pathologic disorders, and chronic or acute diseases associated with abnormalities in the expression, amount or distribution of the protein. The present sequence represents a cDNA of the invention that is differentially expressed in activated vacular tissue. Note: The sequence data for this patent did not form part of the specification, but was obtained in electronic format directly from USPTO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1414
                                                                                                                 The invention relates to a combination comprising cDNAs which are expressed in a disorder or process associated with DNA methylation. The combination and cDNAs are useful for diagnosing, staging, treating or monitoring treatment of cancer, e.g. colon cancer and for detecting changes in expression of genes encoding proteins that are associated with DNA methylation. The protein is useful for screening molecules or compounds to identify at least one ligand that binds to the protein and for producing an antibody. The present sequence represents a cDNA expressed in a disorder or process associated with DNA methylation
New combination comprising cDNAs that are expressed in a disorder or process associated with DNA methylation, useful for diagnosing, staging, treating or monitoring treatment of cancer, e.g. colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TTGACTTGCCTTTTTGTTTCTTTCCTTCATTAGTCCCTCTTCATGCAGTATGGTCATT

The invention relates to a combination comprising several polymucleotides calmodulin gene, human mRNA for KIAA030 protein, leukotriene A4

hydrolase, human mRNA for KIAA030 protein, leukotriene A4

hydrolase, human mRNA for KIAA030 protein, leukotriene A4

mRNA, etc., and their complements. The cDNAs are differentially expressed in LPS (lipopolyasccharide) rereated foam cells. Also included are obtaining an extended or full length gene from a library of nucleic acid sequences, an extended or full length gene from a library of nucleic acid sequences, an extended or full length gene from a library of nucleic acid sequences, an expression vector containing the nucleic acids a host cell composition comprising a protein by culturing the host cell, and a composition comprising a protein by culturing the host cell, and a composition comprising a protein by culturing the host cell, and a composition comprising a protein by culturing the host cell, and a composition comprision with a sample is from a subject with throughput detection of differential expression of one or more cor alterior and amonger from cell-expressed nucleic acids are useful for a high throughput screening of a library of molecules or compounds to identify a ligand which binds a polynucleotide. The library is chosen from the compounds to identify at least one ligand which specifically binds a compounds to identify at least one ligand which specifically binds a compounds to identify at least one ligand which specifically binds a cardiovascular disorder. The foam cell-expressed nucleic acids are useful for diagnosing rational assets one ligand which as earlied or detecting related confidence as elements on a microarray which can be used for detecting related confidence and protein a sample detection a sequence represent a cDNA whose expression compounds to in a sequence represents a cDNA whose expression compounds to incomplete the sequence represents a cDNA whose expression compounds to incompleted the sequence represents a cDNA whose expression compou Combination containing several polynucleotide that are differentially expressed in foam cells and complements of the polynucleotides, useful for diagnosing cardiovascular disease or atherosclerosis. is upregulated in LPS treated foam cells. Claim 1; SEQ ID NO 82; 37pp; English.

The invention relates to 1046 novel nucleic acids which are used as markers for determining the sensitivity of a cancer cell to the anticancer agent TAXOL. Cancer cells can be treated with TAXOL when they care shown to express one of the 242 sensitivity markers or the cells are shown not to express one of the 804 resistance markers. The methods can be used to determine the effectiveness of TAXOL in the treatment of cancer cell growth in an individual. The markers can be used as targets in developing anti-cancer agents such as chemotherapeutic compounds. The markers can also be used as targets in developing treatments for cancer, particularly those cancers which display resistance to agents and exhibit expression of the markers. The anticancer agents developed by the novel method can be used to treat cancer. Probes based on the markers can be used to treat cancer. Probes based on the markers can be markers, in the identification of cells or tissues which mis-express the protein. Cancers which may be targeted include carcinoma (e.g. squamous cell carcinoma), sarcoma (e.g. fibrosarcoma) leukaemia (e.g. lymphocytic leukaemia), lymphoma, plasmocytoma, reticulum cell sarcoma, Hodgkin's disease and tumours (e.g. glioma). The present sequence is one of the
                                                                             Human; cancer cell marker; TAXOL; cytostatic; tumour; carcinoma; squamous cell carcinoma; sarcoma; fibrosarcoma; leukaemia; lymphocytic leukaemia; lymphoma; plasmocytoma; reticulum cell sarcoma; Hodgkin's disease; glioma; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1170 AGCTAGAGGAAGTCCCAAAGAAAACTTGGATTTGCTCTTTCTGACATCTCGGTGGTTAGGT

This invention relates to a combination comprising several CDNAs that are differentially expressed in activated vascular tissue. The invention also discloses a high throughput method for detecting differentially expressed contains of the companion may have antiateriosclerotic; cytostatic; cardiant; hypotensive; antidiabetic; cytostatic; cardiant; hypotensive; antidiabetic; cytostatic; cardiant; hypotensive; antidiabetic; cytostatic; cardiant; hypotensive; antidiabetic; cytostatic; cardiant; hypotensive; antidiabetic; used in gene therapy. The cDNAs of the invention may be used in a high-throughput methods for detecting differential expression of one or more converted in a molecule or compound that specifically binds a converted invention. A protein encoded by the cDNA may be used to screen several molecules or compounds to identify a ligand that specifically binds to the protein, or to produce or purify an antibody to the protein that can be used to detect a protein in a sample or purify a natural or recombinant protein from a sample. The nucleotides may be useful for canonial protein from a sample. The nucleotides may be useful of a vascular disease, e.g. atherosclerosis, cancer, coronary artery disease, hypertension, diabetes, pre-eclampsia, ischaemia- reperfusion of injury, restenosis, or stroke. The cDNAs can also be used for large-scale concluse, Antibodies to the proteins encoded by the cDNAs are useful for molecules. Antibodies to the proteins encoded by the cDNAs can also be used for large-scale associated with abnormalities in the expression, amount or distribution of the protein. The present sequence represents a cDNAs of the invention that is differentially expressed in activated vascular tissue. Note: The sequence data for this patent did not form part of the sequence data for this patent did not form part of the sequence data for this patent did not form part of the sequence data for this patent did not form part of the sequence date for this patent did not form part of the protein.
                                                                                                                                                                                                                       Human; gene; ss; vascular tissue; cytostatic; atherosclerosis; cardiant; hypotensive; antidiabetic; gynaecological; vasotropic; cerebroprotective; gene therapy; vascular disease; concer; coronary; artery disease; hypertension; diabetes; pre-eclampsia; restenosis; ischaemia-reperfusion injury; stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Combination for diagnosing, staging, treating, or monitoring the progression of treatment of a vascular disease, e.g. atherosclerosis, comprises several cDNAs that are differentially expressed in activated
                                                                                                                                                                                   Human cDNA #519 differentially expressed in activated vascular tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 2068 BP; 657 A; 338 C; 452 G; 621 T; 0 U; 0 Other;

This sequence represents a human gene of the invention, that is induced to express by both HGW and interferon (IRN), designated HGW-inducible genes (cigo r cigs). The invention also relates to genes that are repressed in the presence of HGW infection, designated HGW-repressible genes (crg or crgs). The products can be used to obtain agents which can be used for anti-viral therapy, particularly anti-HGW therapy. They can also be used for the development of drugs that would allow for higher associated with administering high levels of IFN. The products can also be used for detection, diagnosis and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, antianaemic; vulnerary; antiinflammatory; immunomodulator;

                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of 444 covel human proteins. These were isolated from expressed sequences tags (ESTs). They can be used to stimulate cell growth, to regulate haematopoiesis e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment to regulate the immune system e.g. to treat multiple solatosis, to regulate activity or inhibin e.g. to treat infertility, to regulate haemostasis or thrombolysis e.g. to treat tinfaminatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. Parkingon's disease. The present sequence is a coding sequence of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The antigenic protein encoded by this sequence can be produced with low cost on a large scale using recombinant DNA methods. It is used for in vitro diagnosis of non-B hepatitis. This DNA sequence can be used as a probe in hybridisation assays, detecting an infecton by the virus. Sea also AANB1260.                                                                                                                                                                       1096
                                                                                                                                                                                     The invention relates to 1046 novel nucleic acids which are used as markers for determining the sensitivity of a cancer cell to the anticancer agent TAXOL. Cancer cells can be treated with TAXOL when they are shown to express one of the 242 sensitivity markers or the cells are shown not to express one of the 804 resistance markers. The methods can cancer cell growth in an individual. The markers can be used as targets in developing anti-cancer agents such as chemotherapeutic compounds in developing anti-cancer agents such as chemotherapeutic compounds in developing anti-cancer agents such as chemotherapeutic compounds the markers can also be used as targets in developing treatments for cancer, particularly those cancers which display resistance to agents and exhibit expression of the markers. The anticancer agents developed by the novel used to detect transcripts or genomic sequences corresponding to the markers, in the identification of cells or tissues which mis-express the

                                                                                                                                                                                                                                                                                                                                                          201
protein. Cancers which may be targeted include carcinoma (e.g. squamous cell carcinoma), sarcoma (e.g. fibrosarcoma) leukaemia (e.g. lymphocytic leukaemia), lymphoma, plasmocytoma, reticulum cell sarcoma, Hodgkin's disease and tumours (e.g. glioma). The present sequence is one of the 1046 novel cancer cell markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1476 GITCATACTAGAGAATCTGCACTATGTTTTCCCTTTTTGTCTTGAGATGAAAGTTTTAA

Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polymuclectide encoding polypeptide, antibody specific to polypeptide or I cell expressing polypeptide.

Claim 1; SEQ ID NO 3921; 489pp; English.

The present invention describes a composition (I) comprising: carriers and immunostimulants; and a polypeptide (III) of a ovarian tumour polypeptide encoded by a polymucleotide (III) having a copy agequence (S1) from the 10912 nucleotide sequences as given in ABL77023 to ABL87934, cfrom the 10912 nucleotide sequences as given in ABL77023 to ABL87934, cor antigen presenting cells that express (II), a T cell population of (II), cor antigen presenting cells that express (II). (I) has cytostatic cativity. An oligonucleotide (IV) that hybridises to (S1) can be used for activity. An oligonucleotide (IV) that hybridises to (S1) can be used for serum or ovarian tissue. The method comprises contacting a biological cample from a patient with (IV), detecting the amount of polymucleotide hybridising the amount to a predetermined cutoff value and thereby detecting ovarian camcer in the patient, where the amount of polymucleotide hybridising to (IV) is detected preferably by polymerase chain reaction (PCR). (I) comprising (III) and/or (III) is tumour protein comprising contacting T cells specific for an ovarian cutomour protein comprising contacting T cells with (III) or (III) is useful in design and preparation of riboxyme molecules for inhibiting contacting in tumour cells; and to isolate a full length gene from a suitable library e.g., a tumour cells; and

This invention relates to a combination comprising several CDNAs that are differentially expressed in activated vascular tissue. The invention also discloses a high throughput method for detecting differentially expressed considerations and in a sample. The CDNAs of the invention may have consideration of the invention may have antiatteriosalerotic; cytostatic; cardiant; hypotensive; antidiabetic; cytostatic; cytostatic, ardiant; hypotensive; antidiabetic; cytostatic ordered considerations and cerebroprotective activities and may be used in gene therapy. The CDNAs of the invention may be used in a high-throughput methods for detecting differential expression of one or more companies, or screening several molecules or compounds to identify a molecule or compound that specifically binds to consider the protein or to produce or purify a ligand that specifically binds to content or the protein or to produce or purify a ligand that specifically binds to content of a vascular disease, e.g. monitoring the progression of treatment of a vascular disease, e.g. atheroscalerosis, cancer, coronary artery disease, hypertension, diabetes, pre-eclampsia, ischaemia- reperfusion in july, restenosis, or stroke. The cDNAs can also be used for large-scale conjugation analysis of several new mucleic acid molecules. Antibodies to the proteins encoded by the cDNAs can content or distribution of the protein. The present sequence represents a cDNA of the invention that content that is differentially expressed in activated vascular tissue. Note: The cyas obtained in electronic format directly from USPTO at the protein of the 1235 2247 Human, gene; se; vascular tissue; cytostatic; atherosclerosis; cardiant; hypotensive; antidiabetic; gynaecological; vasotropic; cerebroprotective; gene therapy; vascular disease; cancer; coronary; artery disease; hypertension; diabetes; pre-eclampsia; restenosis; ischaemia-reperfusion injury; stroke. Combination for diagnosing, staging, treating, or monitoring the progression of treatment of a vascular disease, e.g. atherosclerosis, comprises several cDNAs that are differentially expressed in activated 1116 AGCTAGAGGAAGTCCAAAGAAAACTTGGATTTGCTCTTTCTGACATCTCGGTGGTTAGCA 2128 AGCTAGAGGAAGTCCCAAAGAAACTIGGATTIGCTCTTICTGACAICTCGGTGGTTAGGA 1176 ATTATICCICTGAGTGGGAGCTGGACCCTGTAAAGGATGTICTAATTCTTTTTGTGCTCTGA 2188 ATTATTCCTCTGAGTGGGAGCTGGACCCTGTAAAGGATGTTCTAATTCTTCTGCTCTGA 3; Gaps Length 2515; Sequence 2515 BP; 747 A; 430 C; 538 G; 800 T; 0 U; 0 Other; Query Match

The invention relates to 1046 novel nucleic acids which are used as markers for determining the sensitivity of a cancer cell to the anticancer agent TAXOL. Cancer cells can be treated with TAXOL when they are shown to express one of the 242 sensitivity markers or the cells are shown not to express one of the 804 resistance markers. The methods can be used to determine the effectiveness of TAXOL in the treatment of cancer cell growth in an individual. The markers can be used as targets in developing anti-cancer agents such as chemotherapeutic compounds. The markers can also be used as targets in developing treatments for cancer, particularly those cancers which display resistance to agents and exhibit expression of the markers. The anticancer agents developed by the novel method can be used to treat cancer. Probes based on the markers can be used to detect transcripts or genomic sequences corresponding to the used to detect transcripts or genomic sequences corresponding to the used to detect transcripts or genomic sequences corresponding to the protein. Cancers which may be targeted include carcinoma (e.g. squamous cell carcinoma), sarcoma (e.g. fibrosarcoma) leukaemia (e.g. lymphocytic 1415 TGCTTTTTAACCCACTCCTGGATGCATTTCCCTCCTTGCATTTCCTCTTTTTCTGG 1474

```
Concer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and F can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB37789 represent sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1022
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1142

The invention relates to novel isolated polypeptides (I), and

The invention relates to novel isolated polypeptides (I) are useful for

polyuclectides (II). (I), (II) and the antibody to (I) are useful for

disorders (e.g. congenital and acquired immunodeficiencies, autoimmune

disorders (e.g. rhematoid arthritis), inflammatory conditions, organ

transplant rejections and graft versus host disease, infectious diseases

CC (e.g. hepatitis C), bleeding disorders, haemoglobin abnormalities and

char blood-related disorders (sickle cell anaemia), myeloproliferative

co ther blood-related disorders (sickle cell anaemia), myeloproliferative

co disorders, primary haematopoietic disorders, hyperproliferative disorders

CC (e.g. qaucher's disease, Parkinson's disease), chromosomal abnormalities

CC Alzheimer's disease, Parkinson's disease), chromosomal abnormalities

CC Alzheimer's disease, parkinson's disease), chromosomal disorders (e.g. arrhythmia),

```
The invention relates to an isolated polypeptide. The polypeptide is useful for diagnosing a pathological condition or a susceptibility to a pathological condition in a subject, by determining the presence or amount of expression of the polypeptide in a biological sample and diagnosing a pathological condition or a susceptibility to a pathological condition based on the presence or amount of expression of the pathological condition based on the presence or amount of expression of the pathological condition based on the presence or amount of expression of the pathological condition or a susceptibility to a pathological condition, which involves contacting the polypeptide is useful for preventing the polypeptide is useful for preventing the polypeptide is useful for preventing the condition or the nucleic acid encoding the polypeptide is useful for preventing the polypeptide or the nucleic acid to a mammalian subject. The nucleic acid a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to the polypeptide are useful and an antibody to the polypeptide are useful as administrations. The polypeptide or a susceptibility to the polypeptide or sequence affinity antibodies and increase serum immunosophycessis or to in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2209
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2329
